Blackberry-inspired gesture controls are coming to iPhone A Blackberry-inspired gesture-based control interface is coming to iPhone, according to 9 to 5 Mac. The technology, developed by a Canadian company called GestEase, uses infrared sensors to detect hand movements. The software then works to react to those movements by identifying gestures, such as hitting the home button, or touching the screen to open an application. The software was first demonstrated in 2011, but it has now been redesigned and is being tested in prototype iPhones, according to 9 to 5 Mac. The software also has the ability to control Android-based devices with a dual-monitor setup. Android users can set up the gesture controls through an application. According to 9 to 5 Mac, the app offers simplified gesture-based UI, a quick launch bar, and allows for more complicated tasks like volume control.Q: Algorithm design, Precomputing data for several key mappings. Best Practice? Using a map, say "map" that will hold a key/value pair for each different file I wish to process. The time to load a file, given that I already know the file, is  $O(1)$  The time to set a key/value pair, given that I already know the key and value, is  $O(1)$  The time to get the value given a key, given that I already know the key is  $O(1)$  The time to get a key given a value, given that I already know the key is  $O(1)$  The time to update a value given a key, given that I already know the key is  $O(1)$  The time to update a value given a key and value given that I already know the key and value is  $O(1)$  I am considering the following options, 2d92ce491b
