Using Django 2.0.6 and template language 3.7.3. I have two forms in my Django template in one of which there is a textbox and a button. When I press the button the textbox value is to be updated with the button value. How to do this in django? A: This could be achieved by: Update the name attribute of the textbox in first form with the name attribute of the button in second form Add a method to first form that will be executed after button click (through the action) Update second form field with the value of the textbox Example: first_form.html {% csrf_token %} Save text first_form.html.py def button_function(request): pass Then you need to update the second form using something like this: {% load crispy_forms_tags %} {% csrf_token %} {% crispy form %} form.html {% csrf_token %} {% crispy form %} { stdenv, fetchurl, autoreconfHook, automake, autoconf, libtool, pkgconfig, flex, bison, gettext, grep, grep, xz, patchutils, gtk2, libXtst, libX11, libXdamage, libXt, libXcursor, libXext 2d92ce491b
