What's New in the?

TCP/IP Data Control OCX is a set of ActiveX Data objects to help you monitor your TCP/IP connection. It has the following functions: * Display of TCP/IP details about active socket connections (connected sockets or listening sockets) * Display of TCP/IP details about all open socket connections (including listening sockets, unconnected sockets, and connected sockets that are not open). * Display of TCP/IP details about the connection process (what datagrams are transferred, number of bytes transferred, number of bytes received, time of last packet received, etc.). * Display of data in a data table (you can select the columns). * Display of specific information on the opened socket. From the DevExpress Support Centre... The TCP/IP Data Control OCX enables you to monitor TCP/IP connections on your computer. It provides the following functions: * Display of TCP/IP details about active socket connections (connected sockets or listening sockets) * Display of TCP/IP details about all open socket connections (including listening sockets, unconnected sockets, and connected sockets that are not open). * Display of TCP/IP details about the connection process (what datagrams are transferred, number of bytes transferred, number of bytes received, time of last packet received, etc.). * Display of data in a data table (you can select the columns). * Display of specific information on the opened socket.Solvent based printing inks typically consist of a resin and an organic solvent, in which a pigment or dye is suspended. The solvents used are typically hydrocarbons and often consist of methyl ethyl ketone, naphtha or toluene. These organic solvents evaporate or are removed from the ink vehicle at the print surface, resulting in solvent fumes. The solvents that evaporate contribute to a toxic, flammable, and potentially explosive atmosphere. At the print surface, the volatile organic solvent fumes can contribute to an environment that is hazardous to humans. It is desirable, therefore, to reduce the emission of these volatile organic solvents in a way that does not adversely affect the printing quality. There have been a number of different approaches to reduce the emission of volatile organic solvents and to remove these solvents from the print surface. One approach is to make the organic solvent water soluble so that it can be removed with the aqueous fountain solution. This is described in WO 2004/090615 A1. Another approach is to incorporate a water-soluble binder in the aqueous ink so that the water-soluble binder absorbs the solvent from the ink and it is removed with the fountain solution. For example, U.S. Pat. No. 6,369,883, to R. P. Bussink et al., issued Apr. 9, 2002, describes the use of poly(ethyl
