Branding is the practice of designing a product or service's visual identity, which includes its logo and brand images. The brand includes the overall look of the product, website or organization, as well as the reputation, experience, and quality of the organization. In general, a brand has three elements: name, logo and image. When designing a brand, the client usually provides you with the company name, brand name, and brand logo. Ask yourself, "What kind of experience do I want the customer to have when interacting with my brand?" For example, if you own a restaurant, you'd probably want people to think of your restaurant when they hear your name, and want them to have a positive impression of the restaurant. Your logo is the most effective way to convey your brand. For example, your logo could include a specific style, color, pattern, or technique that represents your company. A brand's logo should reflect the way your company is viewed in the community. When creating your brand, be creative and original! Focus on the visual experience you want your customers to have. I am trying to use an ArrayList of a subclass type in an ArrayList of a superclass type. In my case the subtype is a 3D array. My problem is that Java is only allowing me to access the subtype in the ArrayList of the supertype. Here is a simplified example: public class Super { public class Sub extends Super { public void test() { System.out.println("In Super"); } } public static void main(String[] args) { ArrayList list = new ArrayList(); list.add(new Sub()); Sub sub1 = list.get(0); sub1.test(); } } I get a compile time error: Test.java:7:

Backup your photos on your iPhone, iPad, iPod, or Mac and easily view your images on the go. The app comes with a wide range of features, which should make it worth trying out. The interface is clean and you can quickly access the app. To initiate an export you can, for example, navigate to your iOS device and use the backup/restore menu, which will open the native Photos app. This feature will probably come in handy, if you need to restore your device or you wish to completely backup your data. You can also initiate a backup manually. Press and hold on your home screen until the icon pops up. If you want to restore your device, repeat this process, but hold down until the "Restore" icon appears on the screen. You can also navigate between different backup dates using the month/year labels. Alternatively, you can also use the up and down arrows. To the left of the Home screen you can press the "list" button to see all the photos available on your device. They appear in the list in a chronology order, which makes navigating around the photos a breeze. Exporting all your photos is a three-step process. You can view the list of the photos available on the device, pick the ones you want to export, and finalize the action. The app will give you the chance to choose between export as a zip file, iCloud, JPEG, JPEGXR, PNG, PNG24, JPEG2000 or EXIF. From there you'll be able to choose how the export file will be organized. You can rename the file, add an extension, set its location, change the file format, and even add a message. Exporting your photos can be done in batches or individually. There's a white background option as well, which makes the images look cleaner. For each photo you can use the "make" button in order to add text, location, or choose to fill in the image with a specific color. You can even edit the alt text as well. An interesting feature is the ability to edit the geolocation of each photo by tapping the pinpointed location and choosing the area you wish to cover with your edit. If you need to create a new one, tap on the "add" button on the bottom right and you'll be given a blank canvas to work on. The app also has an offline mode. After downloading the app, tap on the red arrow in the top-left corner and the app will start reading your photos. This feature is quite helpful, especially if you don't have a connection on your iOS device and you need to get your work done. You can also open up a specific folder from your device's main screen by selecting the folder you want to work with, while your photos will
