More particularly, the present invention relates to a fast and efficient FIFO memory in a bus cycle. 2. Related Art FIFOs are used for a wide variety of applications such as, for example, in disk drives where data is written to and read from the disk when the drive is not busy. A FIFO is a memory that can provide data, in series, to the next user. When a FIFO is full, the oldest data in the FIFO is overwritten to create a space in the FIFO. The user of the FIFO is given an address in the memory which is currently being used by the FIFO. The user is prevented from reading or writing data to the address until the FIFO is empty. If the FIFO is empty, the FIFO gives the user an address in which data can be written without overwriting old data. In some circumstances, multiple FIFOs are used to allow simultaneous use of the FIFOs. For example, multiple FIFOs can be used to allow simultaneous use of multiple disk drives in a multiple read/write operation. If the FIFO is empty, the system can use the first empty FIFO, if there are two FIFOs, the system can use the first empty

Field of the Invention This invention relates to a semiconductor device and a method of manufacturing the same, particularly, a technique useful for the microfabrication process for manufacturing a power MOSFET (Metal-Oxide-Semiconductor Field-Effect-Transistor). 2. Prior Art The microfabrication process for manufacturing a power MOSFET has already reached a stage where the channel width is 0.5 μm or less. However, it is not easy to obtain a further finer line width. The problem is described below. In a power MOSFET, usually, a diffusion layer of high impurity concentration is used as a source region to reduce the electric field at the source region, thereby reducing the concentration of electric field to the substrate. In such a case, the impurity atom in the source region is transferred to the channel region when epitaxial growth is carried out for forming the diffusion layer, to increase the concentration of the donor (N type impurity) in the channel region. If the channel width is small, the gradient of the donor concentration varies in the depth direction of the channel region and, 09e8f5149f
