Hamid et al.^[@bibr14-2058-5241.1.000026]^ reported that for 25% of the population, the tibial tuberosity was anterior to the tibial plateau. A lateral tibial plateau is often the

site of insertion of the posterior tibial tendon, which can be pulled anteriorly during squatting or kneeling exercises.

These results suggest that a significant degree of tibial posterior translation might be present in some patients with increased posterior tibial slope. There is a possibility

that the direction of the posterior tibial slope may play a role in the treatment of medial tibio-femoral OA. In medial tibio-

femoral OA, some authors have reported

that the direction of the tibial posterior slope can be predicted by analyzing the extent of the posterior meniscal tears or

the extension of the lateral meniscus tear.

^[@bibr15-2058-5241.1.000026],[@bibr16-2058-5241.1.000026]^ We have classified

the extents of posterior meniscal tears

according to the classification system

proposed by Menard et

al.,^[@bibr17-2058-5241.1.000026]^ and

we have found a positive correlation between the depth of the posterior meniscal tears and the depth of the posterior tibial slope in this study. Similar findings were described by Pilon et al.^{^[@bibr18-2058-5241.1.000026]^} who reported that in 59 patients with
